DETAILED ACTION

1. The amendment filed October 7, 2005 is entered and claims 13-24 are pending.

Allowable Subject Matter

2. Claims 13-24 are allowed.
3. The following is an examiner's statement of reasons for allowance: the claimed invention is directed to the driving method for the LCD electrooptic switching element or LC electrooptic switching element.

Independent claim 13 identifies a uniquely distinct feature "integrating a potential difference between the two electrodes of the electrooptic switching element via an integrator to obtain a time integral value Int of the electric driving voltage; and controlling the change of polarity of the electric driving voltage such that the time integral value Int of the electric driving voltage remains within a predetermined interval $V_{c1} < \text{Int} < V_{c2}$ Where V_{c1} and V_{c2} are electric potentials input to a reference input of a respective comparator"

Independent claim 17 identifies a uniquely distinct feature "a voltage translator, wherein the control signals output by the control "flip/flop" circuit are input to the voltage translator, said voltage translator transforming said control signals into electric driving signals for the electrooptic switching element and outputting the transformed control signals to the electrodes of the electrooptic switching element, the amplitude of said

square-wave electric driving signals being determined by a voltage level V_{lcd} , which is input to a control input of the voltage translator".

Independent claim 18 identifies a uniquely distinct feature "a second analog switch having a select input associated with the output of the comparator such that with every change of the polarity of electric driving signals for the electrooptic switching element, said second analog switch switches for a short time to output from an electrically floating first input to a constant electric potential V_p , at a second input, in order to reset the integrator to an initial state, said analog switching output being input to the integrator and wherein the outputs of the control "flip/flop" circuit are input to the voltage translator, which transforms said control signals into the electric driving signals for the electrooptic switching element and outputs the transformed control signals to the electrodes of the electrooptic switching element, the amplitude of said driving signals being determined by the electric voltage V_{lcd} , which is connected to a control input of the voltage translator".

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Yatabe (Patent # 6,188,395).

The closest arts, Yatabe as discussed above, either singularly or in combination, fails to anticipate or render obvious the above limitations obvious.

4. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
